

Automation seminars in the US and Canada

Easier to operate and impressive in terms of price, performance, quality and functionality: With its TLF210, Bargstedt shows in its own showroom in Hemmoor, at several fairs and now also in the showrooms of some sales partners a storage system which automatically supplies two processing machines with material at once.

This multitalent is equally efficient as a panel cutting center with Holzma panel sizing saw from the HPP series and as a pure material buffer storage system. This plane storage system also makes a big impression in combination with a CNC machine from Weeke. The machines networked with the TLF210 are integrated into the control system via the storage software and are fully automatically supplied with material. The success of the TLF210 stood for reason that also the sales partners who have this 3-machine combination in their showroom would hold an automation seminar with event character.

Homag Canada held such an automation seminar at the end of March 2012 in Toronto.. Homag Canada invited into his own showroom for this event and presented the Bargstedt TLF210 in the Profi version combined with a Holzma saw and a Weeke CNC processing.

Homag Canada 29/03 - 30/03/2012

The computer controlled techniques „made by Bargstedt“ went down well. Customers from 33 Canadian companies with key aspect woodworking visited the seminar at Homag Canada and attended very interested the presentation of the 3-machine combination. Quick, visitants were able to convince themselves of the manifold possibilities through transparent board management, automatic presorting and feeding of the operating machines by the Bargstedt storage TLF210. The promising discussions with customers further emphasized the great interest in the automation and rounded off the seminar.

Stiles Machinery 18/04 - 19.04/2012

Almost 2 weeks later, Bargstedt presented itself during an automation seminar on 18. and 19. April at Stiles Machinery in the USA. Stiles Machinery, independent US-American sales partner of the Homag Group invited for this seminar, the first in 2012, to present a similar combination of Holzma saw, Bargstedt storage and Weeke CNC-processing in its own showroom. Focus of this seminar was also the automation of the operating machines by the Bargstedt plane storage. Grace to the automation by the computer controlled storage system; it was possible to produce 152 parts in 28 minutes parallely in the saw and the CNC-processing. The shown possibilities of the plane storage were an eye opener for the attendees at Stiles, too. Partially with such a huge success that as high point a TLF210 of the profi version could be sold during the event.

The value of the automation for customers from the woodworking handicraft and industry is also shown in the nomination of the cell of saw, CNC-processing and Bargstedt storage for the IWF Challenger Award 2012.
