

BRANDT at Xylexpo 2014

Flexible solutions for high demands

The Italian machine market is still an important one and for this reason BRANDT Kantentechnik GmbH will be present again at the trade fair “Xylexpo 2014”. 2 different models will be exposed in Milan, to introduce a considerable range of innovations. Multistage technologies for trimming and scraping units, multifunctional contour trimming units for corner rounding and flush trimming, and not to forget the airTec activation unit for a perfectly finished zero joint will be shown to the public in Milan.

The Highflex 1440 is one of the two machines, the German machine constructors are bringing with them to Italy. The Highflex series is featured to have a high degree of automation already in its standard version. Besides the standard glue application with a glue roller, the Highflex 1440 is equipped with an **airTec** activation unit to achieve a perfect zero joint. So, the customer has the choice between two systems, in order to meet all requirements ideally.

Flush trimming and corner processing are carried out by a multifunctional contour trimming unit, persuading the customer by an exact positioning and lowest palpation pressure, making this machine the most suitable one for processing both, lightweight boards and high gloss panels, too. The machine is operated by the new designed power**Touch** technology, being institutionally introduced to the market by the HOMAG Group.

The biggest machine of the Lemgo manufacturers at Xylexpo is the Ambition 1660 FSC, which is not only the proper machine for ambitious craftsmen, but also for industrially oriented customers. Not only being upgraded by a top pressure belt for processing delicate surfaces, but also by a total automation of all working units and settings. One of the outstanding features of this machine is the multistage technology of the trimming and scraping units, particularly designed

for those customers, who expect a high degree of flexibility for processing a panel with different radii. The multistage trimming unit offers two different radii and the flush trimming option. The multistage scraping unit offers two different radii. Everything is independently adjustable at the push of a button because all units are equipped with NC spindles.
